Gravity Surveys

Simcoe Geoscience Limited offers land gravity surveys with latest gravity equipment. Our technical staff and team of geophysicist is highly experienced and our mission is, "to work with our clients" in designing and implementing projects focused on achieving their goals in a safe and environmentally friendly manner".

With our worldwide experience, we have the resources and crew to tackle any job, regardless of its geographic location. We have completed number of small and large scale surveys and acquired more than 7000 gravity stations in last two years.

Magnetic Surveys

Simcoe Geoscience Limited offers high resolution ground magnetic surveys using latest magnetic systems. Our technical staff and team of geophysicist is highly experienced and our mission is, "to work with our clients" in designing and implementing projects focused on achieving their goals in a safe and environmentally friendly manner".

Our ground based systems are arranged to reduce both environmental and methodological noise and constant operation of a base magnetometer allows for the correction of diurnal variations, as well as monitoring for magnetic storms or micropulsations during a survey.

Our roving magnetometers are integrated with differentially-corrected GPS (using WAAS) for real-time navigation and positioning and provide continuous mode surveying with sampling rates up to 10 Hz.

Additionally, ground magnetic data (either stand-alone or combined with gravity data) are a cost-efficient way to implement important constraints on geology and/or other geophysical methods (e.g. seismic, CSAMT, IP, EM, etc.) during the modelling process.
